

# Comparison Of Estimated Cost Of Estimation With Detailed Cost Estimation In Building Projects

Trijeti, Sinung Tri Wibowo

**Abstract:** There are two terms in cost estimation, namely estimated cost estimation with detailed cost estimation. Estimated cost estimates are made to obtain an approximate budget picture, while detailed cost estimates are made for contracts. The study was conducted on a 19-story building, starting with the estimated cost estimates calculated based on concrete ratios m3 / m2, iron kg / m3, m2 / m3 formwork, while detailed cost estimates were calculated based on detailed drawings and technical specifications. Making estimated cost estimates in three forms or types namely Block Plan Cost Estimate, Elemental Cost Estimate and Detailed Elemental Cost Estimate on detailed cost estimates. The results showed the contract value of the estimated detailed costs of Rp. 72 billion with a price per m2 of Rp. 1.507.506.76 / m2. The level of approach or accuracy of the estimated cost plan Block Estimate of the estimated cost of detail by 24%, Elemental Cost Estimate of the estimated cost of detail by 15%, Detailed Elemental Cost Estimate of the estimated cost of 4.4%.

**Index Terms:** estimated cost estimation, detailed cost estimates, cost estimates

## 1 INTRODUCTION

Costs are expenses to achieve the goals or benefits received. Cost is also the most important element when an initial idea or concept of a project starts to be assessed. For the project owner the cost will determine once whether a project can be implemented or not, while for contractors the success to get a project is determined one of them by the cost factor. Project costs are grouped into direct costs and indirect costs. Direct costs consist of materials, wages and equipment. Whereas indirect costs consist of overhead, unexpected costs and profits. Estimation is the process of predicting / estimating the cost and time to complete various devertible projects. In the estimation of material, labor, equipment, time, money and others can be classified in two terms, namely estimated cost estimates and detailed cost estimates. Estimated cost estimates are generally made by project owners, developers and consultants with the aim of obtaining an approximate budget picture, while detailed cost estimates are made by contractors, subcontractors, suppliers for contractual purposes. Detailed cost estimates are also made by project owners, developers and consultants as a reference and guide for conducting tender evaluations (evaluating bid prices submitted by bidders). There is a difference between estimated cost estimates and detailed cost estimates. Estimated cost estimates begin to be prepared when the ideas and concepts of a project have been put forward by the project owner or developer. These detailed cost estimates will go through a phasing process during the design stage with an always updated estimate, while detailed cost estimates are made when the tender stage has begun and bill of quantities documents have been prepared. Detailed Cost Estimate is prepared or made based on a bill of quantities that has been equipped with a unit price and the total price of each piece of work. This research was conducted on a 19-story lecture building construction project in Jakarta with a total gross floor area of 47,787.58 m2 which has one semi-basement for parking, 1 floor for a public area, 18 floors for class, 1 floor for sports facilities.

**This research is focused on:**

1. The location used as research is the 19-story lecture building construction project at.
2. The work under study is structural work (concrete, iron, and formwork).

3. Calculation methods used are from Building Cost Consultants.

4. The aspects studied are in terms of cost estimates.

Analysis of the estimated unit price used in this study is the price that has been adjusted to the price prevailing at the time the project is in progress. Analysis of contract unit prices used in this study, namely the prices listed in the contract.

## 2 LITERATURE REVIEW

The project is a temporary activity that takes place in a limited period of time, with the allocation of certain resources with the aim of achieving goals. In managing a project, especially in the construction industry, the main target is the fulfillment of Time, Quality and Cost targets. Time or time is influenced by technical factors where technical factors are determined by how far the readiness is in the planning (design) and implementation (construction) stages, while non-technical factors are determined for example natural conditions, weather and soil geology which are sometimes difficult to predict (unpredictable). If this time is not in accordance with the planned time frame, it will have an impact on costs. The quality factor is not only determined by how good the quality and specifications of the materials, materials and equipment used, but also determined by the workmanship. Although good quality materials, materials and equipment are used, but if the implementation does not meet the specified requirements, the quality results will not be good and of course this will also affect the cost. In implementing a project, it is necessary to consider a risk factor, because this risk factor is something that cannot be avoided and will always be faced in implementing a project. One risk factor that is often encountered in implementing a project is cost or cost (cost plan). If this risk is not anticipated beforehand, it can result in losses and uneconomics in a project. Glenn M. Hardie from the British Columbia Institute of Tecnology in his book "Construction Estimating Technicques" provides the following definition of estimating: "The formation of approximate judgment or opinion regarding the value, amount, size, or weight of something. In construction parlance, an estimate is an expression of opinion or the prediction of the probable future cost of certain construction activities, usually based on some data having an acceptable degree of reliability".

### 3 RESEARCH METHODOLOGY

Data related to the calculation method is the data obtained from the Building Cost Consultant. Secondary data collection: Project image of lower and upper structure work, quantity calculation methods, provisions of structural work ratios (concrete, steel and formwork), cost estimation format, unit price analysis analysis used in this study, namely prices that have been adjusted to the price prevailing at the time of the project, the analysis of the contract unit price used in this study is the price listed in the contract. After all the data is complete, then analyzed so that the results are obtained.

### 4 ANALYSIS AND DISCUSSION

#### 1. Building Data

**Table 1. Gross Area Calculation.**

No.	Uraian	Parkir & podium	Tower (kelas)	Total

#### 2. Calculation of estimated cost

##### Block Plan Cost Estimate

Preparation is done when the idea or concept of a project has been put forward by the project owner (concept design stage). To get the total cost of a building, the unit price is multiplied by the total gross floor area (TGFA).

**Table 2. Volume calculation (BPCE).**

##### **BLOCK PLAN COST ESTIMATE**

Revisi : 0

**2. Calculation of detailed cost estimates**

Detailed cost estimates are made at the tender documentation stage, calculated and compiled based on working drawings which are categorized as tender drawings and based on technical specifications. From the contractor's offer by referring to the bill of quantities (BoQ) made by the quantity surveyor (QS) consultant, the volume is agreed after a clarification meeting (joint calculation) of volume calculation between the Project Owner, QS Consultant and Contractor. Hereinafter referred to as a list of job descriptions and bills or quantities of BoQ

**3. Unit Price Analysis (Estimated)**

**a. Block Plan Cost Estimate**

Unit price of the Plan Cost Estimate is based on references from several similar projects.

**Unit Price Analysis (Contract)**

The unit price is obtained from the final negotiation of the contractor or contract offer. For preliminaries work, the value has been determined through a bidding process followed by negotiations until agreed upon preliminary value of 15% of the total value of structural work.

**5 DISCUSSION RESULT**

From the discussion and analysis above, the following results are obtained:

**1. In terms of calculation methods.**

Estimated cost estimates are calculated based on concrete ratios m<sup>3</sup> / m<sup>2</sup>, iron kg / m<sup>3</sup>, m<sup>2</sup> / m<sup>3</sup> formwork, while detailed cost estimates are calculated based on detailed drawings and technical specifications.

**Figure 1. Concrete Volume Comparison Chart.**

**Figure 2. Iron Volume Comparison Chart.**

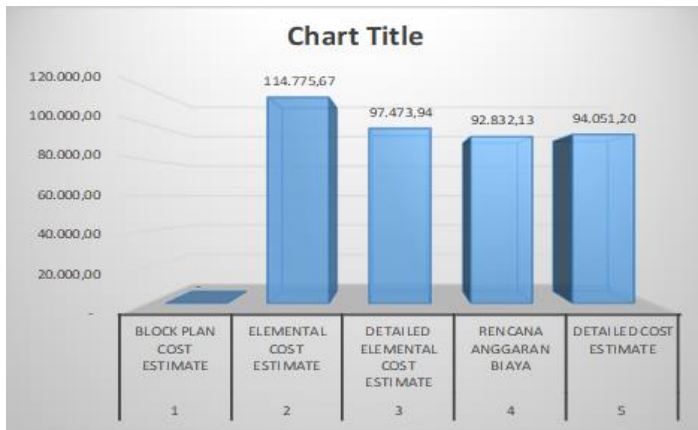

Figure 3. Formwork Volume Comparison Chart.

In terms of cost estimates.

- Analysis of the total value of the Plan Cost Estimate (BPCE) of Rp. 89,362,800,000 (including 10% VAT) at a price per m2 of Rp. 1,870,000,53 / m2.
- Analysis of the total value of Elemental Cost Estimate (ECE) of Rp. 82,692,100,000 (including 10% VAT) at a price per m2 of Rp. 1,730,409.87 / m2.
- Analysis of the total Detailed Elemental Cost Estimate (DECE) value of Rp. 75,218,800,000 (including 10% VAT) at a price per m2 of Rp. 1,574,024.05 / m2.
- Analysis of the total value of the Budget Plan (RAB) of Rp. 70,597,100,000 (including 10% VAT) at a price per m2 of Rp. 1,477,310,63 / m2.
- Analysis of the total Detailed Cost Estimate (DCE) value of Rp. 72,040,100,000 (including 10% VAT) at a price per m2 of Rp. 1.507.506.76 / m2.

Figure 4. Cost Comparison Chart.

## 6 CONCLUSION

The level of approach or accuracy of the estimated cost plan Block Estimate against Detailed Cost Estimate (contract) is 24%, Elemental Cost Estimate against Detailed Cost Estimate (contract) is 15%, Detailed Elemental Cost Estimate against Detailed Cost Estimate (contract) is 4.4%, shows that the purpose of doing Cost Estimating in parallel with the design stage has been achieved, i.e.:

- A realistic budget is reached.

- Obtain a decent and profitable budget.
- Get an economical and efficient design.
- Design and budget can be controlled and adjusted.
- Design according to the allocated budget.
